

The Date Crew - Product & Tech Generalist Assessment

Expected time: 60–90 minutes

Purpose: We want to understand how you think, prioritise, use data, and use technology to solve a problem.

You do **not** need to build a production-ready product.

You may use ChatGPT, Claude, Cursor, Lovable, Replit, spreadsheets, Python or any other tool.

In fact, we expect you to use AI.

What matters is whether **you understand the problem and the solution you propose.**

The Problem

At The Date Crew, our matchmakers recommend profiles to clients.

We use emails to share the profiles and communicate with our clients

Imagine the following data from the last 30 days:

Stage	Number
Profiles shared	1,000
Profiles accepted	310
Contact details shared	210
Conversations started	150
Meetings fixed	75
Meetings completed	42

We also observe:

- Matchmaker A has a **44% profile acceptance rate**
- Matchmaker B has a **21% profile acceptance rate**
- Around **35% of rejected profiles were rejected for reasons already mentioned in the client's preferences** – these preferences are the same that every other matrimonial platform takes in with an addition of deal breakers like smoking preferences, willingness to have children etc.
- Matchmakers spend around **2 hours per client per week searching for profiles**
- Rejection feedback is mostly unstructured free-text
- Some clients frequently reject profiles initially but later accept profiles with very similar characteristics

The leadership team comes to you and says:

"Use technology and AI to improve our matchmaking process."

Your Challenge

Part 1 - Diagnose the Problem

You have joined The Date Crew today.

Before building anything, tell us:

1. What are the 3 most important questions you would investigate?

For each question, explain **why it matters**.

2. What do you think is the biggest problem in the funnel above?

You can make assumptions, but clearly state them.

3. Which 3 metrics would you track?

Explain why you chose them.

Keep this section to approximately **300 words**.

Part 2 - Design a Solution

Pick **ONE problem** from the scenario.

Design a solution that could realistically be built by **one person in two weeks**.

Your solution could be:

- an internal tool
- an AI workflow
- an automation
- an algorithm
- a dashboard
- a process improvement
- or a combination of these

Explain:

Problem

What exactly are you solving?

User

Who will use it?

Solution

How would it work?

Data

What information would you need?

Technology

What tools / APIs / AI models / systems would you use?

Success Metric

What number should improve if your solution works?

Keep this section to approximately **500 words**.

Part 3 - Build Something Small

Create a small prototype of the most important part of your solution.

It does **not** need to look beautiful.

For example, you could build:

- A tool that converts rejection feedback into structured reasons

- A profile-ranking system
- A client preference checker
- A matchmaking dashboard
- An AI assistant for matchmakers
- An automated workflow
- Something completely different

You can use mocked data.

The prototype should demonstrate the **core idea**, not the complete product.

Part 4 - One Curveball

Assume your solution launches.

Two weeks later:

The metric you were trying to improve does not move at all.

Tell us:

1. What would you check first?
2. What data would you look at?
3. Would you iterate, change the solution or kill it?

Maximum **200 words**.

Submission

Please submit:

1. Your answers

PDF / Notion / Google Doc.

2. Prototype

A working link, screenshots or short screen recording.

3. Code

GitHub link

4. AI Usage

In 3–5 lines tell us:

- Which AI tools you used
- What you used them for
- One thing the AI suggested that you disagreed with or changed

Important

We are **not judging you on polish.**

We are trying to understand:

- Can you identify the real problem?
- Can you prioritise?
- Can you use numbers instead of intuition alone?
- Can you use technology pragmatically?
- Can you build something quickly?
- Can you explain your thinking clearly?

A simple solution to the right problem will score significantly better than a complicated solution to the wrong problem.
